Summary Participant Leaflet

EVITA: A randomised trial of aminophylline, magnesium sulfate or salbutamol intravenous therapy for acute severe asthma in children and young people

Please refer to the full Participant Information Sheet for more details.

What is the trial about?

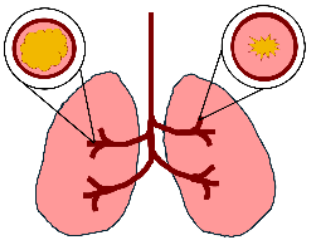

EVITA
Evaluation of Intravenous Therapy in Asthma

This hospital is taking part in a research trial (EVITA) to find out which is the best treatment for severe asthma attacks in children and young people (CYP).

Three intravenous (IV) medications are commonly given in the UK to treat severe asthma attacks: aminophylline, magnesium sulfate or salbutamol. Although all three medications are effective at treating asthma attacks, doctors are not sure which one works the best.

The EVITA trial aims to compare these medications to determine which is best at treating severe asthma attacks.

What will happen if I take part?

If you enter the trial, you will be randomised to receive one of the three IV medications (aminophylline, magnesium sulfate or salbutamol) to treat your severe asthma attack. Randomised means everyone taking part in the research trial has an equal chance of receiving one of the three medications. A sample of your blood would be saved to measure your level of salbutamol (blue inhaler medicine).

You would be asked to complete two sets of questionnaires. One just after you start in the trial and another set just before you go home from hospital. These would ask you about your health, wellbeing, asthma, and your experience of the treatment you would have received.

You would then be contacted 30 days after you entered the trial with one final questionnaire to ask about your health, wellbeing, asthma, your experience of the treatment you would have received and answer any other questions you have about the trial.

	You would be asked if you'd like to take part in optional activities too. We'd like to collect a saliva sample to see whether specific changes in your genes can predict how well the trial medication might have worked for you. We'd also like to invite you to be interviewed at another time to understand how you feel about the treatment you would have received. The interview will occur within 45 days of starting in the trial.

Do I have to take part?

	No. Taking part in the trial is entirely voluntary. If you decide to take part, you are still free to withdraw at any time without giving a reason and without any disadvantage to yourself. For us to understand and respect your decision, you will be asked to complete and sign the 'EVITA Withdrawal of Consent Form.'

Are there any benefits / risks?

	**Benefits**: By taking part in the trial, you will be providing doctors with valuable information about which medication is the best treatment for CYP having a severe asthma attack. **Risks**: As with any drug, side effects are possible; however, some side effects are rare, and most patients do not have any problems. Since the treatments used within this trial are routinely used for severe asthma attacks, the potential benefits of each of these IV medications outweigh their potential risks.

How will my data be used?

	In this trial we will use information collected during your hospital stay and information that is already in your medical records. We will only use information that we need for the trial. We will let very few people know your name or contact details, and only if they really need it for this trial. Everyone involved in this trial will keep your data safe and secure. We will also follow all privacy rules. At the end of the trial, we will save some of the data, in case we need to check it, and for future research. We will make sure no-one can work out who you are from the reports we write.

Thank you for taking the time to consider taking part in this trial.
